

Neutral/ Ground Kit

Model 006612-0

DESCRIPTION

In some applications, installers wish to change double-pole circuit breakers for single-pole circuit breakers. In order to accommodate the additional neutral wires, the dual neutral/ground kit can be installed on pre-wired switches to provide the additional needed landing spaces.

In other applications, wire nut connections within the main electrical panel are not allowed per local code interpretation. In this situation, the installer needs to add an additional gang box to accommodate the connections. This is no longer required with the dual neutral/ground kit. In this situation the additional bar can be installed and a jumper wire ran from the bar to the ground post. This allows installers to run the branch wiring directly into the switch by providing the means to ground each circuit within the pre-wired switches.

Note: This kit cannot be used in both applications simultaneously. It must be used for either only neutral or only ground.
